

# Documentation of the House Prices App

*lestarr*

*February 23, 2016*

The presented app is very simple, it simulates the calculating of house price based on room number and location. The user can select or change the number of bedrooms and the neighborhood of the location in the left panel called

## **Your data**

In the right panel the choices are presented again and the predicted house price appears below the title

## **The predicted house price**

This app is only a simulation of the prediction function and should be used rather as a game. The prediction is based on the Boston dataset from the MASS library in R, but it is very trivial just to show the functionality of the app.
